Voice over Internet Protocol (VoIP) enables you to make phone calls using a broadband Internet connection instead of an analog phone line. VoIP phone systems are extremely cost effective for businesses that have multiple locations which work off the same network. It is also cost effective for businesses that place many international phone calls because VoIP eliminates long distance charges.

Other VoIP features include call blocking, call forwarding, voicemail, caller ID, 3-way calling, fax and redial capabilities, conferencing, Microsoft Outlook integration, customized hold music, and many more! Wave Technology will help you determine the best VoIP system for your business.
